Individual Income Tax Rates, 1985

By John Labate and Dan Holik*

For Tax Year 1985, an increase in adjusted gross income (AGI) of \$162 billion and an increase in taxable income of \$119 billion brought about an 8 percent increase in total income tax—from \$302 billion for 1984 to \$326 billion for 1985. This increase in total income tax occurred despite indexing of the 1985 tax rate schedules and of personal exemption amounts for the effects of inflation by the Economic Recovery Tax Act of 1981 (ERTA) [1]. The average total income tax on returns that showed a tax for 1985 was \$3.931, a \$233 increase from 1984.

Figures A and B show the general decline since 1981 in the average tax rate on taxable returns [2]. For 1985 the average tax rate was steady at 14.4 percent of AGI, although this was slightly higher than the average rate for 1984 [3]. Based on a distribution of all taxable returns by the size of AGI, the median taxable return had an AGI between \$20,000 and \$21,000 for 1985, up from between \$19,000 and \$20,000 for 1984. (For further information on the number of returns, income tax, and average tax by size of AGI, see Table 3 of the Selected Statistical Series at the end of the Bulletin.)

Figure A.—Adjusted Gross Income, Total Income Tax, Average Tax Rate, and Average Total Income Tax, 1979-1985

			Taxable returns											
Tax	Total number of					Average p	er return

¹ The average tax rate (total income tax as a percentage of AGI for taxable returns) for 1984 was 14.397, and the average rate for 1985 was 14.418.

NOTE: The average adjusted gross income, average total income tax, and average tax rate were calculated from unrounded data. Average tax rate is Total income tax as a percentage of adjusted gross income.

CALCULATION OF TAXES FOR 1985

Taxpayers used one of four tax rate schedules for 1985, depending on the taxpayer's filing status. There were separate schedules for married persons filing joint returns, married persons filing returns separately from their spouses, individuals qualifying as heads of households,

and other single persons [4]. The tax rates in each schedule ranged from 0 to 50 percent [5].

The application of different tax rates to a particular return is illustrated in Figure C, which shows how tax was calculated for 1985 for a married couple with a \$25,000 AGI, filing a joint return, claiming two exemptions, and not itemizing deductions. Taxpayers who filed joint returns for 1985 were taxed at a tax rate of 0 percent on the first \$3,540 of taxable income, 11 percent for the next \$2,180, 12 percent for the following \$2,190, and so forth.

To simplify the tax computation and to reduce the number of errors, taxpayers with less than \$50,000 of taxable income (and who did not use income averaging) were required to determine their tax from the Tax Table rather than the tax rate schedules. The amount of tax shown in the Tax Table was equal to the tax on the midpoint of the income bracket (generally each bracket was \$50 wide), as calculated from the appropriate tax rate schedule, rounded to the nearest whole dollar. According to the 1985 Tax Table, for married taxpayers filing a joint return with taxable income between \$22,900 and \$22,950, the tax was \$3,017. In this example, the Tax Table tax is greater than the tax rate schedule tax (\$3.016 in Figure C) by \$1, since the Tax Table tax was computed on the midpoint of the \$22,900 to \$22,950 income bracket (\$22,925), and the taxable income in Figure C is \$22,920. The tax computed from the Tax Table or the tax rate schedules plus any "taxes from special computations" equals income tax before credits [6]. For Tax Year 1985, the regular and income averaging methods of tax computation were the only methods of tax computation available [7].

Indexing of the tax rate schedules was introduced for 1985 to avoid an increase in taxes as a percentage of AGI, caused by nominal income increases due to inflation (as measured by the Consumer Price Index for urban consumers) [8]. In Figure D, a tax is derived using the 1984 (non-indexed) tax rate schedule, zero bracket amount (\$3,400), and personal exemption amount (\$1,000) for the same \$25,000 AGI as in Figure C. The \$97 or 3.2 percent difference between the higher tax for 1984 derived in Figure D (\$3,113) and the actual tax for 1985 derived in Figure C (\$3,016) shows the effect of indexing.

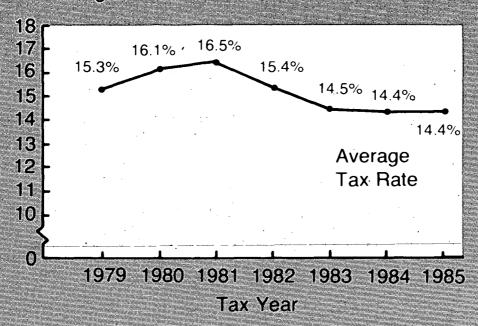

Certain income and deduction items described as "tax preferences" were subject to the alternative minimum tax, which was payable in addition to the ordinary income tax. For Tax Year 1985, the alternative minimum tax was com-

^{*}Individual Returns Analysis Section. Prepared under the direction of Susan Hostetter, Chief.

puted on separately-determined "alternative minimum taxable income" (income subject to the ordinary tax plus items of tax preference). The alternative minimum tax was the excess of the 20 percent tax on alternative minimum taxable income over the ordinary tax on regularly-determined taxable income. More than 427,000 returns reported alternative minimum tax totaling \$3.8 billion for 1985.

MARGINAL TAX RATES

As shown in Figures C and D, different portions of the income included on a return may be taxed at different rates. The tax rate applied to the last dollar of income is the marginal tax rate for that return. Since tax rates increase with income (from 0 to 50 percent), the marginal tax rate is the highest rate applied to the return. In Figure C, the taxpayer had portions of income taxed at seven tax rates ranging from 0 to 22 percent. The marginal tax rate in this instance is 22 percent. Note that the marginal tax rate as defined here is based only on income included in AGI. Consequently, this marginal rate may differ from an effective marginal rate computed on a taxpayer's total income, which would include, for example, tax-exempt interest and, for 1985, the nontaxable portion of long-term capital gains, and the dividend exclusion [9].

Marginal tax rate data for Tax Year 1985 are presented in Tables 1 and 2, which include returns with the regular tax computation and returns with the income averaging computation. Data in these tables are based on returns with "taxable income" only. For Tax Year 1985, the total number of individual returns filed (Figure A) was 101,660,287, of which 96,429,715 returns had a taxable income amount, while 82,846,420 returns were "taxable" (reporting income tax after credits and the additional tax for preferences). (See Taxable Income in the Definitions section for a more detailed discussion.)

Returns are classified by two different methods in Table 1. In columns 1 through 9, a return is classified by the marginal or highest tax rate. For example, column 1 shows that there were 9,451,657 returns for which the marginal tax rate was 18 percent. Columns 5 and 6 show that, for these returns, the amount of tax generated at the 11 through 18 percent rates totaled \$17.9 billion while the amount of tax generated solely at the marginal rate of 18 percent totaled \$3.0 billion. In columns 10 through 12, a return is classified by each rate that generated a tax. For example, columns 10, 11, and 12 show that 49,027,250 returns had some income taxed at the 18 percent rate; \$159 billion of this income was taxed at the 18 percent rate, and \$28.7 billion of income tax was generated at the 18 percent tax rate [10].

The amount of tax generated by each specific tax rate, ranging from 11 to 50 percent, as well as the corresponding number of returns and the amount of modified taxable income, are presented in Table 2. These data are classified by size of AGI. For example, column 1 shows that 5,212,090 returns with taxable income had an AGI between \$14,000 and \$16,000; column 7 shows that 5,164,172 of these returns had a portion of income taxed at the 11 percent rate. These returns had \$8.7 billion of modified taxable income at the 11 percent rate (column 8), and the 11 percent bracket generated nearly \$1.0 billion of tax (column 9).

Tables 1 and 2 do not include any tax attributable to the alternative minimum tax, which was computed on a different base from that used for the statistics in these two tables.

DEFINITIONS

Complete definitions of the technical terms used in this article and accompanying tables—for example, taxable income, tax generated and income averaging—are beyond the scope of this article. More extensive definitions may be found in *Statistics of Income—1985, Individual Income Tax Returns*. Brief definitions of the major tax concepts discussed in this article follow:

Adjusted Gross Income.—Adjusted gross income (AGI) was computed by subtracting statutory adjustments (prima-

rily business, investment or employee-related deductions, such as payments to an Individual Retirement Arrangement (IRA)), from total income recognized under the tax code. Total income included the net amounts from sources such as salaries and wages, business income, rents, royalties and, in turn, excluded, for example, most social security benefits, and a certain portion of capital gains.

Average Tax Rate—The average tax rate presented in this article was the ratio of total income tax to AGI.

Marginal Tax Rate.—The marginal tax rate presented in this article was the highest tax rate applied to any portion of income from a return. As defined for the data presented in this article, the marginal tax rate is based only on income included in AGI. Thus, the marginal tax rate may differ from an effective marginal tax rate computed on total income subject to tax under the Internal Revenue Code. (See Footnote 9 for a further discussion of effective marginal tax rates.)

Modified Taxable Income—Modified taxable income is the technical term used to describe the actual tax base computed for the statistics. For taxpayers using the regular tax computation method, modified taxable income is identical to taxable income. However, for taxpayers who used the income averaging computation, a modified taxable income was computed specially for the statistics by imputing a hypothetical taxable income amount necessary to yield the given amount of tax when subject to tax under the appropriate, ordinary tax rate schedule as if income averaging had not been used.

Taxable Income—For taxpayers who used the regular tax computation method and those who used income averaging, taxable income was the amount reported on line 37 of the individual income tax return (i.e., AGI less the personal exemption amount, and less either allowable charitable contributions for non-itemizers or total allowable itemized deductions for all others).

Tax Generated—This was the tax computed from the tax rate schedules on the amount of modified taxable income. Therefore, it excludes the "alternative minimum tax." For most returns (those without one of the "taxes from special computations" described in Footnote 6), tax generated equalled income tax before credits.

Total Income Tax—Total income tax was the sum of income tax after credits and the additional tax for tax preferences (primarily the alternative minimum tax).

DATA SOURCES AND LIMITATIONS

These statistics are based on a sample of individual income tax returns (Forms 1040, 1040A, and 1040EZ) filed

with the Internal Revenue Service in 1986. Returns in the sample were stratified based on the larger of total income or total loss; size of business plus farm receipts; the presence or absence of Schedule C, Profit (or Loss) from Business or Profession; and Schedule F, Farm Income and Expenses. Returns were selected at rates ranging from 0.03 percent (for the more numerous smaller-size returns) to 100 percent (for the relatively few returns with large income amounts), resulting in 121,418 returns being selected from a population of 101,836,347.

Because the data presented in this article are estimates based on a sample, they are subject to sampling, as well as nonsampling, error. To make proper use of the statistical data provided, one must know the magnitude of the potential sampling error.

Figure E presents approximate coefficients of variation (CV's) for frequency estimates. The approximate CV's shown here are intended only as a general indication of the reliability of the data. For a number other than those shown, the corresponding CV's can be estimated by interpolation.

Figure E.—Coefficients of Variation for Frequency Estimates, 1985

•	0.50

The reliability of estimates based on samples, the use of coefficients of variation for evaluating the precision of sample estimates, and nonsampling error considerations are discussed in the methodological Appendix at the back of this Bulletin.

NOTES AND REFERENCES

- [1] The Economic Recovery Tax Act of 1981 (ERTA) indexed 1985 tax rate schedules, including the zero bracket amount (or standard deduction), and the amount deductible for personal exemptions, to adjust for inflation. For further information on tax law changes for 1985, see Statistics of Income—1985, Individual Income Tax Returns.
- [2] A return was considered to be "taxable" if an amount was reported for "total income tax" (the sum of income tax after credits and the additional tax for tax preferences, primarily the alternative minimum tax). "Total income tax" did not include other related taxes reported on the individual income tax return, such as self-employment tax, tax from recapture of prior-year

- investment credit, and social security tax on tip income (under the Federated Insurance Contribution Act (FICA)). For 1985, the total number of taxable returns was 82,846,420.
- [3] The average tax rate (total income tax as a percentage of AGI for taxable returns) for 1984 was 14.397, and the average rate for 1985 was slightly higher at 14.418.
- [4] Taxpayers who did not remarry after the death of a spouse in 1983 or 1984, and who had a dependent living with them, could qualify for surviving spouse status. Those who qualified for surviving spouse status could use the married filing joint tax rates when filing their 1985 returns.
- [5] The 1985 tax rate schedules were published in the 1985 Instructions for Preparing Form 1040. The schedules are reproduced in Statistics of Income— 1985 Individual Income Tax Returns.
- [6] Taxes from special computations included tax on accumulation distributions of trusts, and the tax on the ordinary income part of lump-sum distributions from qualified retirement plans. Taxes from special computations did not include tax from recomputing prior-year investment credits, self-employment tax, social security tax on tips, or taxes from individual retirement arrangements. These taxes were included in "total tax liability," which is defined in Statistics of Income—1985 Individual Income Tax Returns. Tables 1 and 2 do not use the concept of total tax liability.
- [7] The income averaging computation permitted part of an unusually large increase in income for 1985 to be taxed at lower rates, resulting in a lower amount of tax due than would have resulted if taxpayers had computed their tax using the regular method. If the income averaging computation was used, the income tax before credits had to be computed from the tax rate schedules rather than from the Tax Tables.

- [8] See section 1(f) of the Internal Revenue Code of 1954, introduced by the Economic Recovery Tax Act of 1981. The Consumer Price Index (CPI) is published by the Bureau of Labor Statistics, U.S. Department of Labor. For further information about the CPI, see Consumer Price Index; Concepts and Content Over the Years, Report No. 17, and Monthly Labor Review, Bureau of Labor Statistics.
- [9] For the tables presented in this article, the marginal tax rate was the rate at which the taxpayer's last dollar of taxable income was taxed. The calculation of an "effective" marginal tax rate for a given return depends upon: 1) the type(s) of income (for example, salaries and wages, long-term capital gains) reported on the return, and the order in which that income was assumed to be "stacked" (described below), 2) the type of tax computation used (regular or income averaging), and 3) whether an alternative minimum tax was reported. If a taxpayer reported income from both salaries and long-term capital gains, the calculation of an effective marginal tax rate would depend on the order in which the income sources were "stacked." If the last dollar of income were assumed to be from salaries and wages, the effective marginal tax rate would be the tax rate derived directly from the appropriate tax rate schedule. If the last dollar of income were assumed to be from long-term capital gains, the effective marginal tax rate calculation would include the capital gains exclusion. For example, \$100 of long-term capital gains generated \$40 of AGI subject to the 50 percent marginal tax rate. While the stated marginal tax rate on AGI was 50 percent, the effective marginal tax rate computed on the \$100 of capital gains income was 20 percent. The income averaging tax computation is discussed in Footnote 7, and the alternative minimum tax is discussed in the "Calculation of Taxes for 1985" section of the article.
- [10] Dollar amounts presented in this section and in the tables are rounded; therefore, the amounts may not add to the corresponding column totals.
